*Design Patterns Lab-05*

## Problem Statement

You are building an e-commerce platform where different kinds of products can be sold. Products can either be simple products (e.g., a laptop, a phone) or bundles (e.g., a holiday gift basket, which contains several simple products). A bundle can also contain other bundles.

Descriptions:

- Product: These are individual products with a price, name, and description.
- Bundle: A bundle is a group of products or other bundles sold together at a discounted or fixed price.

Both simple products and bundles should be treated the same way when it comes to displaying their details and calculating the total price.

## Task

You can create all the products and bundles you want. But at the end you should display all the product information and calculate total price.

*You can call the function to display product information and calculate price only ONCE.*
